Dataset health report

D:\STUDY\8th sem\project\ML Studio\examples\contest-launcher-verified\cleaning-source.csv

Dataset version: 0

Health indicator: 99.93/100. Mean of completeness (99.86%) and exact-row uniqueness (100.00%). This is not a measure of predictive accuracy or validity.

id	title	severity	status	columns	count	method	explanation	recommendation	risk	evidence
1	Potential outliers	Low	Potential Issue	[x]	2	1.5 × IQR fences	Extreme observations are not necessarily errors.	Review a box plot and original records.	Deleting extremes can bias the data.	[-3.078332, -2.683104]
2	Missing values	Medium	Confirmed Issue	[amount]	1	isna	0.8% of this column is missing.	Review median or most-frequent imputation inside the training pipeline.	No imputation strategy suits every dataset; whole-data imputation can leak validation information.	[3]
3	Surrounding whitespace	Low	Confirmed Issue	[category]	40	Compare stripped labels	Whitespace can split equivalent labels.	Preview trimming whitespace.	Whitespace can occasionally be meaningful.	[A, A, A, A, A, A, A, A]
4	High cardinality / possible identifier	Medium	Potential Issue	[event_date]	120	Distinct ratio > 90%	Nearly every record has a different label.	Check whether this is an identifier before modeling.	Removing a meaningful feature can reduce predictive value.	[]
5	Infinite numeric values	High	Confirmed Issue	[edge]	1	Positive or negative infinity	Some numeric entries are infinite and cannot be used directly by the training pipeline.	Review these rows. Preview replacing infinity with missing, then let training handle missing values inside its split.	Infinity may carry domain meaning; review the original values before changing them.	[0]
